Hi Meghan and Claire,

Great to chat with you today. Thanks Claire for joining at the last minute.

Just a quick update to say...

1. The site now lives at <https://fastr-analytics.org> Nothing else changes. Site still builds from the github, etc.
2. I have added a netlify badge to the top of the github README that shows the status of the live site. Usually this will show "success". It will say "building" for 30-60 seconds after you git push. And if any of our pushes breaks the site, this will show "error" in red. Idea of this is just in case you're not seeing your updates in the live site, you can check on github to see if it did build successfully or not.

Tim

Thanks Tim! Great to speak to you both today, excited to see how this continues to take shape.

Meghan

Awesome! It looks great, so nice to have everything in one place!

Claire

Hi Tim,

A few things for the next methodology sync.

1. I just changed how the methodology images work. They used to live in two places: methodology/resources, which is what the methodology chapters reference, and /resources at the repo root, which is what the workshop slides, handouts, and the deck builder web app reference. That setup wasn't great. I had to keep the same files in sync across both folders, and it was easy to update one place and forget the other. So I made methodology/resources a pointer to /resources, so we have one source of truth for both slides and chapters.

For your sync, this means the image copy step is going to come up empty next time. Your sparse-checkout only grabs methodology/, so the pointer is fetched but the actual files (a level up) aren't. There are a few ways to fix:

- On your end, you could also grab resources/ and copy from there (as per Claude recommendations):

```
sparse-checkout set methodology resources
const resSrc = join(tmp, "repo", "resources")
```

- Or I put methodology/resources back as a real folder with the duplicate, and you don't change anything.

- Or we work on the idea we talked about today: pull all the screenshots, diagrams and visuals out into a dedicated asset folder (either here or on your side), and the methodology, slides and handouts all reference that. It's a bigger change but probably the cleanest fix in the long run.

What do you think we should do in the short term?

2. Most methodology chapters have `<!-- SLIDE:mX_Y --> ... <!-- /SLIDE -->` blocks at the bottom. Those are where I extract workshop slides locally. If you vendor the .md as-is, those blocks render as page content on the site and duplicate the chapter prose above. **It would be worth stripping everything between `<!-- SLIDE: -->` and `<!-- /SLIDE -->` in your normalise().**

3. A few chapters use BibTeX [`@author2020`] style cites and there's a .bib file in methodology/. Those cites now render as literal text on Starlight. Any ideas on how to deal with that?

4. Your site already covers a few of the methodology chapters in its own sections, so you can probably skip vendoring these:

- 03_fastr_analytics_platform.md
- 03b_ai_assistant.md
- 11_user_guide.md

I would also recommend skipping my *index.md* which was my cover page on the MkDocs.

5. The methodology chapters use a lot of MkDocs Material collapsibles, which are lines that start with `??? "title"` with content indented underneath. I use them to tuck away implementation detail that would otherwise clutter the chapter, things like the lists of excluded indicators, the input and output file structures, the R function signatures, and configuration constants. The reader can click to expand them if they want the detail, otherwise the chapter stays readable. There are roughly 120 of these across the DQA, adjustment, service use, coverage and user guide chapters.

Claude tells me that Starlight doesn't support that syntax, so they render as literal text on the site. It would be worth handling them in `normalise()`. Claude tells me that the easiest mapping is probably to `<details><summary>...</summary>...</details>` HTML, which Starlight supports natively. Or you could use whichever collapsible component Starlight has if there's a better one.

6. There's also a `disclaimer.md` sitting in `methodology/`. We should think about where this actually belongs on the site. It could be a footer, a separate page, or it could stay where it is. I'm happy to move it wherever makes sense once we figure that out.

Let me know what you want me to handle in my repo.

Cheers,
Claire

Thanks! All this makes sense.

#1 Let me update the sync script so that it grabs resources/ and copies from there (your first option, Claude recommended)

#2 Will do

#3 I'll write a parser to extract these and cite them properly, so you can leave as is. Unless you actively want to change things on your end.

#4 I think these depend on whether you want to maintain them in your methodology repo. If you are happy to delete, let's delete them from yours. Otherwise I'll add note for the sync to skip them.

#5 Will look into this. Nice to have the collapsible element as something we can use.

#6 I'll take a look and might just copy it once into the site repo. Then we don't have to worry about syncing them. Can't imagine this changes too often.

Thanks again for following up with all this. I'll let you know when I've fixed things up.

Tim
